

Change Request: Offer Dates, Service Cards and Inventory Timestamps

Project: MB Center admin website | Area: Offers, service cards, floating summary log, inventory/warehouse records

This document translates and clarifies the Bulgarian change request into an implementation-ready brief for Claude Code. The main goal is to prevent service-card creation and stock deduction side effects from incorrectly changing offer and inventory timestamps.

1. Plain-English Summary

There are three related timestamp rules to fix:

- In the offers list, the displayed date should be the service card date when a service card exists for the offer. If no service card exists, show the original offer creation date.
- Creating a service card must not change the offer update/last-modified timestamp shown in the offer log/floating summary. The offer update timestamp should change only when actual offer fields are edited. Notes/remarks are an exception and should not update this timestamp.
- Creating a service card deducts quantities from inventory, but this must not update the inventory item timestamps. Inventory item timestamps should change only when the inventory item itself is edited from the warehouse/stock area.

2. Files / Areas Mentioned

Area	File / Component	Expected concern
Offers list	@offers/page.tsx	Date column should prefer service-card date over offer creation date.
Offer edit page	@offers/edit/page.tsx	Offer update log should not be changed just because a service card was created.
Floating summary	@FloatingSummary.tsx	Displayed "Offer updated at" timestamp should remain tied to true offer updates only.
Inventory / warehouse	@earnings/page.tsx	Stock deduction caused by service-card creation should not modify inventory item updated dates.

3. Detailed Requirements

Requirement 1 - Offers list date behavior

Location: @offers/page.tsx, offers table date column. Current issue: the list appears to show only the offer date. Required behavior:

- If an offer has a created service card, display the service card date in the date column.
- If an offer does not have a service card, display the offer creation date.
- Keep the existing date formatting, sorting behavior, filters and UI style unless a code change is required to make sorting/filtering consistent with the displayed date.

Implementation hint: compute a dedicated display date, for example `displayDate = serviceCard.createdAt || offer.createdAt`, or the equivalent schema fields used in this codebase.

Requirement 2 - Offer update log must not change when service card is created

Locations: @offers/edit/page.tsx and @FloatingSummary.tsx. In the reference screenshot, the log shows “Оферта актуализирана на: 05.05.2026 г., 13:11” (“Offer updated at: 05.05.2026, 13:11”). Current issue: when a service card is created, the offer updated date/time changes too. This is wrong.

- Creating a service card should not update the offer’s updatedAt/lastModified timestamp.
- The “Offer updated at” log should keep the timestamp of the last real offer update.
- If no editable offer data is changed, this timestamp must remain unchanged.
- Exception: changes to notes/remarks should also not update this offer update timestamp, even though the remarks content may be saved.

Implementation hint: separate business events. Service-card creation should create/update service-card records and possibly related links/status, but it should not call the generic offer update path that touches offer.updatedAt. If the database auto-updates updatedAt on any offer write, avoid writing to the offer during service-card creation or use a dedicated field/transaction strategy that preserves the previous updatedAt.

Requirement 3 - Inventory item timestamps must not change from service-card stock deduction

Location: @earnings/page.tsx / stock/inventory item records. Current issue: when a service card is created, the app deducts the related quantities from inventory. That deduction is correct, but it also changes the date/time fields on the affected inventory items. Required behavior:

- Creating a service card should still deduct the correct inventory quantities.
- The inventory item date/time should not change because of this automatic deduction.
- The inventory item date/time should change only when a user directly edits something in the inventory/warehouse area for that specific item.

Implementation hint: distinguish between “stock quantity movement caused by service card” and “manual inventory item edit”. If there is an auto-updated updatedAt field on inventory records, consider using a separate stock movement ledger or preserving the previous inventory item updatedAt during automatic quantity deductions.

4. Acceptance Criteria

- Create an offer without a service card: the offers list date shows the offer creation date.
- Create a service card for that offer: the offers list date now shows the service card date.
- After creating the service card, the “Offer updated at” timestamp in the floating summary remains unchanged from before service-card creation.
- Edit a normal offer field: the “Offer updated at” timestamp updates correctly.
- Edit only notes/remarks: the “Offer updated at” timestamp does not update.
- Create a service card that deducts inventory: stock quantities decrease correctly, but inventory item timestamps do not change.
- Manually edit an inventory item from the stock/warehouse page: only that item’s timestamp updates.
- Existing UI formatting, buttons, labels and styling remain unchanged unless needed for the timestamp fix.

5. Reference Images

Reference Image 1 - Offers list page: the date column in @offers/page.tsx is the target for Requirement 1. Use the screenshot supplied in the chat together with this brief.

Reference Image 2 - Offer edit / floating summary log: highlighted area shows the “Offer updated at” timestamp that must not be changed by service-card creation.

6. Claude Code Prompt

You are working on a Next.js / React admin website for MB Center.

Please implement the following timestamp/date behavior fixes. Keep the existing UI, styling, formatting and Bulgarian labels unchanged unless a small change is technically required.

Context / files to inspect:

- @offers/page.tsx
- @offers/edit/page.tsx
- @FloatingSummary.tsx
- @earnings/page.tsx
- Any API routes, server actions, database queries, Prisma/ORM models or utility functions involved in offers, service cards and inventory updates.

Business rules to implement:

1) Offers list date column

In @offers/page.tsx, the date displayed in the offers table should follow this rule:

- If the offer already has a service card, display the service card date.
- If the offer does not have a service card, display the offer creation date.

Preserve existing date formatting, sorting and filters. If sorting/filtering currently uses the old offer date, update it so it stays consistent with the date displayed to the user.

2) Creating a service card must not update the offer update timestamp

In @offers/edit/page.tsx / @FloatingSummary.tsx, the log text "Оферта актуализирана на: ..." should represent the last real offer update only.

Currently, when a service card is created, this date/time changes as if the offer itself was updated. This is incorrect. Required behavior:

- Creating a service card must not change offer.updatedAt / lastModified / the timestamp shown in the floating summary.
- If no real editable offer data changes, the offer update timestamp must stay unchanged.
- Exception: changes to notes/remarks should not update the offer update timestamp either.
- Normal edits to real offer fields should still update the timestamp correctly.

Important implementation note:

If the database schema automatically updates updatedAt whenever the offer row is written, avoid writing to the offer during service-card creation where possible, or preserve/restore the previous updatedAt in the transaction. Prefer a clean separation between service-card creation and offer-update tracking.

3) Creating a service card must not update inventory item timestamps

When a service card is created, the correct stock quantities should still be deducted from inventory. However, this automatic stock deduction must not change the date/time fields shown for the affected inventory items in @earnings/page.tsx.

Required behavior:

- Service-card creation deducts the required quantities from stock.
- The inventory item updatedAt/date/time must remain unchanged during this automatic deduction.
- The inventory item timestamp should update only when a user manually edits that inventory item from the stock/warehouse area.

Important implementation note:

Separate "stock movement caused by service card" from "manual inventory item edit". If inventory.updatedAt is auto-managed by the ORM/database, use a separate stock movement/quantity update path or preserve the existing item updatedAt during automatic deductions.

Acceptance tests / manual verification:

- Create an offer without a service card: the offers list date shows the offer creation date.
- Create a service card for that offer: the offers list date shows the service card date.
- After service-card creation, the floating summary "Оферта актуализирана на" timestamp remains unchanged.
- Edit a normal offer field: the offer update timestamp changes correctly.
- Edit only notes/remarks: the offer update timestamp does not change.
- Create a service card that uses stock: quantities are deducted, but inventory item timestamps do not change.
- Manually edit an inventory item: that specific item timestamp updates.

Before editing, inspect the current data flow and identify which writes are causing unwanted updatedAt changes. After implementing, summarize exactly which files you changed and how you prevented these unwanted timestamp side effects.
